## Announcements - 12 Nov 2013

1. Exam 4 not that far away...
a. Starts a week from Thursday! Yikes!
b. Evening TA exam review voting soon

## Review: Ideal Gas Law

## $P V=N k_{B} T$

$P V=n R T$

## Worked Problem

How much volume will 1 liter of liquid nitrogen fill when it becomes gas?
Density of LN $=0.807 \mathrm{~g} / \mathrm{cm}^{3}$
Molar mass of $\mathrm{N}_{2}=28 \mathrm{~g} / \mathrm{mol}$
Temperature in this room $=$ about $70^{\circ} \mathrm{F}$ (=294.3 K)
Atmospheric pressure in Provo $=0.85 \mathrm{~atm}$

Answer: 821 L

## Worked Problem

What is the mass of all the air in this room? The average molar mass of the molecules in air (mainly nitrogen and oxygen) is $29.0 \mathrm{~g} / \mathrm{mol}$.

## Worked Problem

Use the ideal gas law to determine the density of air at 1 atm and $80^{\circ} \mathrm{F}$ (300K). $\left(\mathrm{MM}_{\text {air }}=29 \mathrm{~g} / \mathrm{mol}\right)$

## Molecular View of Pressure

## Pressure: Comes from collision forces of molecules hitting wall

Related problem: You throw baseballs (mass 145 g ) at a wall (area 9 $\mathrm{m}^{2}$ ), at a speed of $85 \mathrm{mph}(38 \mathrm{~m} / \mathrm{s})$. The collisions are elastic, and last for 0.05 seconds. (This is the time the ball is in contact with the wall.) A baseball hits the wall every 0.5 seconds. How much average pressure is generated by the baseballs? (Do this in three steps)
(a) How much force is generated by each hit? (Use impulse)
(b) How much force is there, on average?
(c) How much overall pressure is generated by the balls?

Answers: 22.04 N; 2.449 Pa

## The actual problem <br> A cube filled with gas (focus on x-direction for now)

Molecules (mass $m$ ) hit the right wall, at a speed of $v_{x}$. Elastic collisions. How much pressure is generated by the molecules? (Do this in four steps)
(a) How much force is generated by each hit?

(b) How much force is there from one molecule, on average?

Answers: $\frac{2 m v_{x}}{\text { time of collision }} ; \frac{m v_{x}{ }^{2}}{L}$
(c) How much pressure is generated by the molecules?
(d) Expand to N molecules, and 3 dimensions $\left(v_{x}=v_{y}=v_{z}\right) . \mathrm{P}=$ ?

Answers: $\frac{m v_{x}{ }^{2}}{V} ; \frac{N m\left(\frac{1}{3} v^{2}\right)}{V}$

$$
P V=N m\left(\frac{1}{3} v^{2}\right)
$$

$\rightarrow$ Does this look familiar?

Compare to:

$$
\begin{aligned}
T & =\frac{m}{k_{B}} \frac{1}{3} v^{2} \\
& \rightarrow \frac{1}{2} m v^{2}=?
\end{aligned}
$$

I will give you this equation on exam. Use it to solve for $v$ !

## Kinetic Energy

$$
\begin{aligned}
& \mathrm{KE}_{\text {tot }}= \\
& \mathrm{KE}_{\mathrm{x}}= \\
& \mathrm{KE}_{\mathrm{y}}= \\
& \mathrm{KE}_{\mathrm{z}}= \\
& \hline
\end{aligned}
$$

"Degrees of freedom"

## Equipartition Theorem

Only briefly mentioned in your book! And not by name! (see page 390, Section 12.2 in $8^{\text {th }}$ edition)
"The total kinetic energy of a system is shared equally among all of its independent parts, on the average, once the system has reached thermal equilibrium."

Specifically, each "degree of freedom", of each molecule, has "thermal energy" of: $\qquad$
"independent parts": larger for molecules that can

- rotate
- vibrate
(requires more than one atom)
$\rightarrow$ such molecules have more "internal energy"

## Translational kinetic energy

Three independent directions

Result: $\quad K E_{\text {ave }}=\frac{1}{2} m v_{\text {ave }}{ }^{2}=\frac{3}{2} k_{B} T$

## Rotational kinetic energy

We'll revisit this later

## From warmup

An ideal gas has a mixture of heavy and light molecules at the same temperature. The molecules with the most [translational] KE are...
a. heavy
b. light
c. same

## Demos

## Kinetic theory machine

## Molecular speed

## Worked Problem

How fast are the oxygen molecules traveling in this room? (300 K)

Answer: $483.46 \mathrm{~m} / \mathrm{s}$ ( = $1081 \mathrm{mph}!)$

## Heat

Heat is random kinetic energy!
Symbol: Q
Units: Joules
"Mechanical equivalent of heat": James Joule 1849

## calories vs. Calories

1 calorie $=4.186 \mathrm{~J}$
Food calorie: 1 Cal
= a kilocalorie

## "Specific heat"

How much does $T$ rise when heat energy is added?

- temperature rise is proportional to heat added
- the more mass... the less the temperature rises
- material dependent

$$
Q=m c \Delta T
$$

$c=$ "specific heat" (closely related to "heat capacity")
$m$ c sometimes called "thermal mass"

## Question:

If you add 5 J of heat to a mass of water, and 5 J of heat to the same mass of copper, which one increases the most in temperature?
a. Water
b. Copper

TABLE 11.1

## From warmup

The fact that desert sand is very hot in the day and very cold at night is evidence that sand has a:
a. Iow specific heat
b. high specific heat

## Phase Changes

From warmup: Thermal energy that is used to melt or freeze something is called:
a. latent heat
b. specific heat
c. thermal mass

## Phase Changes

During phase change, no $T$ increase
$\rightarrow$ but heat still needed to complete the phase change
$\rightarrow$ both phases co-exist

## Latent Heat Equation

$$
Q=m L
$$

$L$ depends on

- Material
- Type of phase change (i.e. solid-liquid, liquid-gas, or other)

## Water:

$$
\begin{aligned}
& L_{\text {melting/freezing }}=3.33 \times 10^{5} \mathrm{~J} / \mathrm{kg} \\
& L_{\text {boiling/condensing }}=2.26 \times 10^{6} \mathrm{~J} / \mathrm{kg}
\end{aligned}
$$

## Clicker quiz

If you want to melt a cube of ice that's initially at $-40^{\circ} \mathrm{C}$, which part takes the most energy?
a. Raising the temperature to $0^{\circ} \mathrm{C}$
b. Converting from solid to liquid phase
c. Same energy

Water:

$$
\begin{aligned}
& c=4186 \mathrm{~J} /\left(\mathrm{kg}^{\circ} \mathrm{C}\right) \\
& L_{\text {melting/freezing }}=3.33 \times 10^{5} \mathrm{~J} / \mathrm{kg}
\end{aligned}
$$

## From warmup

Ralph's professor stated "If you add an ice cube to a glass of water, the temperature of the water does not necessarily decrease." That seems bizarre to him, because ice is obviously used to cool down water! Can you help him understand what his professor may have been talking about?
"Pair share"-I am now ready to share my neighbor's answer if called on. a.Yes

## Calorimetry

Conservation of energy
$Q_{\text {gained by cold objects }}=Q_{\text {lost by hot objects }}$
Blueprint!
(assuming no heat flow to outside)
$\rightarrow$ On both sides of equation use only positive quantities (absolute values)
$\rightarrow$ Don't forget melting and boiling $m L$ terms if needed

My method vs. book's method

## Worked Problem

0.2 kg of iron at $100^{\circ} \mathrm{C}$ is added to an insulated container with 0.2 kg of ice at $-10^{\circ} \mathrm{C}$. How much ice melts if they come to equilibrium at $0^{\circ} \mathrm{C}$ ? (Ref: $c_{\text {iron }}=448 \mathrm{~J} / \mathrm{kg} \cdot{ }^{\circ} \mathrm{C}$ )

Start with: $Q_{\text {gained by ice }}=Q_{\text {lost by iron }}$

## Worked Problem

## 5 g of hot iron at $300^{\circ} \mathrm{C}$ is added to 100 g of water at $30^{\circ} \mathrm{C}$. What is the

 final temperature?
## Worked Problem

500 g of hot iron at $300^{\circ} \mathrm{C}$ is added to 100 g of water at $30^{\circ} \mathrm{C}$. What is the final temperature?

Answers: 124.1 (not real answer), $-395.3^{\circ} \mathrm{C}$ (not real answer), $100^{\circ} \mathrm{C}$

## Clicker quizzes (review)

1. Which molecules have the most kinetic energy?
a. The heavy ones
b. The light ones
c. Same
2. Which molecules have the fastest speed?
a. The heavy ones
b. The light ones
c. Same
