## Announcements - 26 Sep 2013

## 1. Exam $\mathbf{2}$ is coming up!

a. Exam 2 begins one week from today (Thurs), runs through the following Wednesday, 2 pm (late fee after 2 pm Tuesday)
b. Thursday will be exam review, whole lecture
c. Covers Chapters $4 \& 5$, Homeworks 5-9
$\rightarrow$ HW 9 due on Thurs night
2. TA evening exam review session either Wed or Thursday a. I will send out link to poll, like I did last time

## New topic: Work and Energy

## Demo: Moving a cart at constant velocity

Question: Who did the most "work"?
a) the one who lifted the cart
b) the one who moved the cart horizontally
c) same work done

## Definition of work in physics

$$
W=F_{/ /} d
$$

(not a vector!)

The work done by a force on an object is the component of the force along the direction of motion (" $F_{/ / \prime \text { ") times the magnitude of the object's }}$ displacement.

Units of work?

$$
W=F_{/ /} d
$$

What if $\mathbf{F}$ is in line with $\mathbf{d}$ ?

What if $\mathbf{F}$ is at an angle $\theta$ away from $\mathbf{d}$ ?

What if $\mathbf{F}$ is opposite $\mathbf{d}$ ?

What if F is not constant?

## From warmup

When you carry an object across the room, without lifting it or setting it down, you do no "mechanical work" on it.
a. true
b. false

You need to carry a suitcase up a flight of stairs. In which case will you do the most mechanical work?
a. You carry the suitcase up quickly.
b. You carry the suitcase up slowly.
c. Both cases involve the same amount of work.

The amount of potential energy possessed by an elevated object is equal to
a. the distance it is lifted
b. the force needed to lift it
c. the work done in lifting it
d. its acceleration due to gravity

## Clicker quiz

A girl pulls a sled up a hill at constant speed. Which forces do negative work on the sled?
a. Friction only
b. Friction and gravity
c. Friction, gravity, and the normal force
d. No forces do negative work

## From warmup

According to the reading assignment, a car coasting from rest down two hills, one steeper than the other, would arrive at the bottom of each hill with the same speed, as long as the two hills have the same vertical height. (Of course, this is true only if we neglect friction and air resistance.) This confuses Ralph, since he realizes that the acceleration of the car down the steep hill will be greater than down the other hill. What should you tell him to help clear this up?
"Pair share"-l am now ready to share my neighbor's answer if called on.
a. Yes

## Kinetic Energy

Defn: Object's ability to do work that comes from its motion.

$$
K E=1 / 2 m v^{2}
$$

## Derivation:

Ball pushes fictitious

Ball in motion, sticks to block

What is $\Delta \mathrm{x}$ ? Use Kinematics... $v_{f}{ }^{2}=v_{0}{ }^{2}+2 a \Delta x$

$$
\begin{aligned}
& 0=v^{2}+2\left(-\frac{F}{m}\right) \Delta x \\
& \Delta x=\frac{m v^{2}}{2 F}
\end{aligned}
$$

How much work does the object do as it stops?

$$
\begin{aligned}
W & =F \Delta x \\
& =F\left(\frac{m v^{2}}{2 F}\right) \\
& =\frac{1}{2} m v^{2}
\end{aligned}
$$

## Why use work/energy?

$\rightarrow$ It is often easier!
Some problems that are hard using Newton's 2nd law can be worked easily with energy ideas, if you don't need to know $\qquad$ !

## Law of Conservation of Energy

$$
\boldsymbol{E}_{\text {before }}+\boldsymbol{W}=\boldsymbol{E}_{\text {after }}
$$

aka "Work-Energy theorem"
Blueprint!!

## Problem solving hint:

Always draw "before" and "after" pictures. Maybe also draw a FBD for the "between" section if there are forces doing work.

## Worked problem

A boy pulls his toy mass $m$ with a force $P$, at an angle $\theta$ above the horizontal. The toy has an initial
 velocity of $\boldsymbol{v}_{0}$. Disregard friction.

How fast is the toy going after the boy pulls it a distance $D$ ?
Method 1: The old way
a. Use N2 to figure out acceleration
b. Use kinematics equations to figure out final speed, time, or whatever is wanted.

Method 2. Conservation of energy

Answer: $\sqrt{v_{0}{ }^{2}+\frac{2 P D \cos \theta}{m}}$

## Worked problem

You pull on a 60 kg load with a force of 80 N at an angle 30 degrees above horizontal. It starts from rest, and after traveling 12 meters, it's going $3 \mathrm{~m} / \mathrm{s}$. There is also some work done by friction. Use $g=10 \mathrm{~m} / \mathrm{s}^{2}$. What is $\mu_{k}$ ?

Step 1: Draw before and after pictures, and a FBD for the in-between part.

Clicker quiz 1: I have done this.
a. yes
b. no

Clicker quiz 2: How many terms need to be part of the "work" part of the conservation of energy equation?
a. 0
b. 1
d. 3
e. 4
c. 2

## Step 2: Write down the blueprint equation

Clicker quiz: I have done this.
a. yes
b. no

Step 3: Fill in the blueprint as much as you can (using letters)
Clicker quiz: I have done this.
a. yes
b. no
$\rightarrow$ What do you do about the unknown normal force?
Step 3b: Think about terms in the blueprint that you don't know

## Step 4: Fill in the numbers, and solve for the unknown

Answer: $\mu_{\mathrm{k}}=0.0835$

## Potential Energy

## Defn: Object's ability to do work that comes from its position.

$$
P E_{q}=m g y \quad \text { P.E. of Gravity }
$$

Derivation:

What must $F$ be in order to avoid accumulating kinetic energy?
How much work does the object do as it stops?

## Another way of looking at it:

$\mathrm{PE}_{\text {gravity }}$ keeps track of the $\qquad$ done against gravity

Change in PE for the different paths?

## From warmup

The amount of potential energy possessed by an elevated object is equal to
a. the distance it is lifted
b. the force needed to lift it
c. the work done in lifting it
d. its acceleration due to gravity

## "Conservative" vs. "nonconservative" forces:

What happens to the energy when you brake your car? Other forms of energy?

Law of Conservation of Energy

$$
K E_{\text {before }}+P E_{\text {before }}+W_{\text {noncons }}=K E_{\text {after }}+P E_{\text {after }}
$$

## Worked Problem

You throw a ball straight up with an initial velocity of $11 \mathrm{~m} / \mathrm{s}$. How high does it go?

Method 1: kinematics

Method 2: energy

## Question: How long does it take?

$\rightarrow$ Can only be done with kinematics

## Demo: Duckpin ball pendulum

## Video: Triple Track

## Video: Pole Vaulter

Q: How high can pole jumpers jump?
(Simple Analysis)
First: how fast can people run (short distances)?

## Compare: Pole vault world record: 6.14 m

## Review: Conservation of Energy

"Energy cannot be created or destroyed, only changed from one form into another..." [mostly true]

$$
E_{\text {before }}+W=E_{\text {after }}
$$

"Law of conservation of energy"

## Statement one:

$$
K E_{\text {bef }}+W=K E_{\text {aft }} \begin{aligned}
& \begin{array}{l}
W \text { must include work } \\
\text { done by all forces }
\end{array} \\
& \hline
\end{aligned}
$$

Statement two:

$$
K E_{\text {bef }}+P E_{\text {bef }}+W=K E_{\text {aft }}+P E_{\text {aft }}
$$

$W$ includes only work by nonconservative forces

Both cases: W can be positive or negative, and can contain multiple work terms (one for each appropriate force)

## Clicker quiz

You throw three balls from a cliff over the ocean with the same initial speed. One is thrown straight up, one straight down, and one horizontally. Ignoring air resistance, which ball has the highest speed just before it hits the ocean?
a. thrown straight up
b. thrown straight down
c. thrown horizontally
d. all the same speed

## Demo: Racing balls

Clicker quiz: Which ball will win the race?
a. The ball that dips down
b. The ball that doesn't dip down

## Demo: Cart being pulled on track

Demo problem: Dr Colton hangs a $\qquad$ kg mass from a pulley and attaches it to a $\qquad$ kg cart with a string. He lets the hanging mass fall $\ldots \quad \mathrm{m}$. How fast is the cart going at the end?

Check: How long does it take to go there?
