

# Announcements – 14 Oct 2014

1. Prayer

“Which of the problems from last night's HW assignment would you most like me to discuss in class today?”

# Center of Mass

What is the center of mass?

How does the center of mass move?

**Demo:** Foam object

## Worked Problem

An artillery shell of mass 20 kg is moving east at 100 m/s. It explodes into two pieces. One piece (mass 12 kg) is seen moving north at 50 m/s. What is the velocity (magnitude and direction) of the other piece?

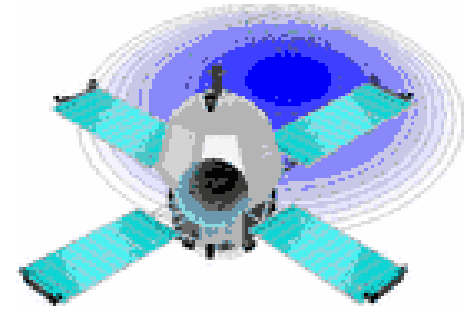

Answers:  $v_x = 250$  m/s;  $v_y = -75$  m/s;  $v = 261$  m/s at  $16.7^\circ$  south of east

# Circular Motion

**Demo:** Bicycle wheel

Complicated motion of rotating body:  
Different  $r$ ,  $v$ ,  $a$ 's for different parts

But same \_\_\_\_\_

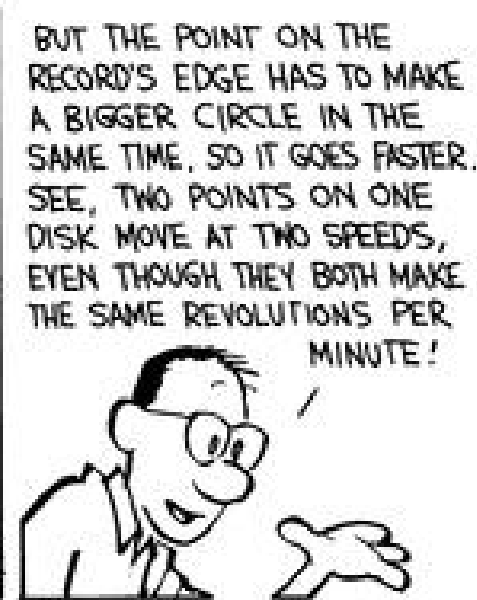

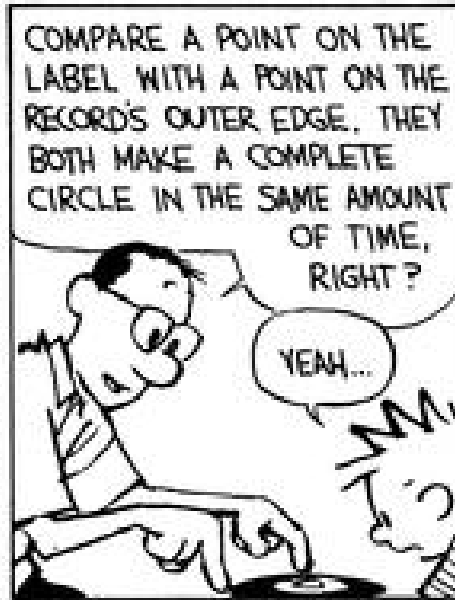

## From warmup

Which has greater linear speed, a horse near the outside rail of a merry-go-round or a horse near the inside rail?

- a. outside horse
- b. inside horse
- c. both the same

## Calvin & Hobbes, Bill Watterson

# Do revolutions relate to angles?

**Question:** Which angle is greatest:

- a. 30 revolutions
- b.  $30^\circ$
- c. 30 radians

# Definition of radian

How many radians in one circumference?

How many radians in  $360^\circ$ ?

→ I will not give you these conversion factors on exam!

How many radians in an arc of length “s”?

# What is angular speed? (aka angular velocity)

**Clicker quiz:** The symbol  $\omega$ , used for angular velocity, is pronounced:

- a. “al-pha”
- b. “double-you”
- c. “gam-ma”
- d. “om-e-ga”
- e. “pi”

## From warmup

Which has greater *angular* speed, a horse near the outside rail of a merry-go-round or a horse near the inside rail?

- a. outside horse
- b. inside horse
- c. both the same

# Angular quantities

displacement  $\Delta\theta = \theta_f - \theta_i$

average velocity  $\omega_{ave} = \frac{\Delta\theta}{\Delta t}$

average acceleration  $\alpha_{ave} = \frac{\Delta\omega}{\Delta t}$

**Units?**

# Kinematic equations (for constant *angular* acceleration)

Substitutions:

$$\begin{array}{l} x \rightarrow \theta \\ v \rightarrow \omega \\ a \rightarrow \alpha \end{array}$$

## Regular kinematic

$$\text{Definition: } v_{ave} = \frac{\Delta x}{\Delta t}$$

$$\text{Definition: } a_{ave} = \frac{\Delta v}{\Delta t}$$

For constant  $a$ :

$$x = x_0 + v_0 t + \frac{1}{2} a t^2$$

$$v = v_0 + a t$$

$$v^2 = v_0^2 + 2a(x - x_0)$$

## Angular kinematic

$$\omega_{ave} = \frac{\Delta \theta}{\Delta t}$$

$$\alpha_{ave} = \frac{\Delta \omega}{\Delta t}$$

For constant  $\alpha$

$$\theta = \theta_0 + \omega_0 t + \frac{1}{2} \alpha t^2$$

$$\omega = \omega_0 + \alpha t$$

$$\omega^2 = \omega_0^2 + 2\alpha(\theta - \theta_0)$$

## Some Guidance, a.k.a. What I Do

1. Pretend a problem involves regular distances & velocities, and figure out how you would solve it
2. Then use the corresponding angular equations

## Worked Problem

Friction slows down a 10 cm radius spinning top with angular deceleration of  $7 \text{ rad/s}^2$ . It was initially spinning at  $6 \text{ rad/s}$ .

How many radians/degrees/revolutions will it turn before stopping?

“Translated problem”: Friction slows down a block,  $a = -7 \text{ m/s}^2$ . It was initially travelling at  $6 \text{ m/s}$ . How far will it go before stopping?

Answer: 2.57 rad,  $147.3^\circ$ , 0.409 rev

## Worked Problem, cont.

Friction slows down a 10 cm radius spinning top with angular deceleration of  $7 \text{ rad/s}^2$ . It was initially spinning at  $6 \text{ rad/s}$ .

How long will it take to stop?

“Translated problem”:

Answer: 0.86 s

## From warmup

If a woman walks 1 meter around the circumference of a 1 meter radius circle, what is the angular measure of her travel?

- a.  $1/2$  rad
- b. 1 rad
- c. 2 rad
- d.  $\pi/2$  rad
- e.  $\pi$  rad
- f.  $2\pi$  rad

# Angular motion of the whole object vs. motion of a spinning point

Angular displacement  $\Delta\theta$  vs “distance around circumference”, s

Angular velocity  $\omega$  vs tangential speed  $v$

Angular acceleration  $\alpha$  vs tangential acceleration  $a$

**Important:** You must use radians if you want to use these equations

## Worked Problem, same situation as before

Friction slows down a 10 cm radius spinning top with angular deceleration of  $7 \text{ rad/s}^2$ . It was initially spinning at  $6 \text{ rad/s}$ .

Consider a point on the rim.

- What is its initial velocity (m/s)? (magnitude, direction)
- What is its initial acceleration ( $\text{m/s}^2$ )? (magnitude, direction)

Answers:  $v_{\text{tan}} = 0.6 \text{ m/s}$ ;  $a_{\text{tan}} = -0.7 \text{ m/s}^2$ ;  $a_c = 3.6 \text{ m/s}^2$ ;  $a_{\text{tot}} = 3.667 \text{ m/s}^2$ ; dir =  $11.0^\circ$  away from inward

# Intro to Torque

A force supplies a **torque** on an object when it is applied in such a way that could cause the object to \_\_\_\_\_

**Definition:**  $\tau = r_{\perp} F$

**Note:** where do you measure the distance  $r$  from?

If the object is rotating:

If the object is standing still:

Above all, be \_\_\_\_\_

# Clicker quiz

In order to apply the most torque, you should:

- a. apply the force perpendicular to  $r$
- b. apply the force at a  $45^\circ$  angle from  $r$
- c. no difference

# Positive vs. negative torques:

Is torque a vector?
