

## Lecture 36: Mon, 31 Mar 2008

Reading quizzes: no talking, no looking in your books/notes

Q1. The Rayleigh criterion for image resolution is (using the "jinc" function):

- a. The second peak's maximum should be located at least as far away as the first peak's *first minimum*.
- b. The two peaks should be separated by at least the first peak's *full width* at half maximum
- c. The two peaks should be separated by at least the first peak's *half width* at half maximum

Q2. A lens placed after a diffraction aperture causes the Fraunhofer pattern to be produced:

- a. before the focal length
- b. at the focal length
- c. after the focal length (but at finite distance)
- d. at infinity

Q3. A Gaussian-shaped beam, when diffracting through an "infinitely large aperture", turns into:

- a. another Gaussian-shaped beam
- b. a  $(\text{jinc})^2$ -shaped beam
- c. a Lorentzian-shaped beam
- d. a  $(\text{sinc})^2$ -shaped beam

problem cont'd from last time -

$$F.T. = e^{ikx/2a} \underbrace{\left[ a \text{sinc}\left(\frac{kx}{2}\right) \right]}_{\substack{\text{Shift of} \\ \text{square}}} \left[ a \text{sinc}\left(\frac{ky}{2}\right) \right]$$

$$+ e^{i k_x (-2a)} \underbrace{\left[ 2\pi a^2 \frac{J_1(kra)}{kra} \right]}_{\substack{\text{Shift of} \\ \text{circle}}} \quad F.T. \text{ of circle}$$

$$F.T. = e^{-ikx/2a} \underbrace{\left[ e^{i4k_x a} \sin \frac{kx}{2} \sin \frac{ky}{2} + 2\pi \frac{J_1(kra)}{kra} \right]}_{\substack{-ikx/2a \\ e^{i4k_x a}}}$$

$$\text{so } I = I_0 \left| e^{i4k_x a} \sin \frac{kx}{2d} \sin \frac{ky}{2d} + 2\pi \frac{J_1\left(\frac{k\sqrt{x^2+y^2}a}{d}\right)}{k\sqrt{x^2+y^2}a} \right|^2$$

complicated, but doable!

See plot on next page

WDR

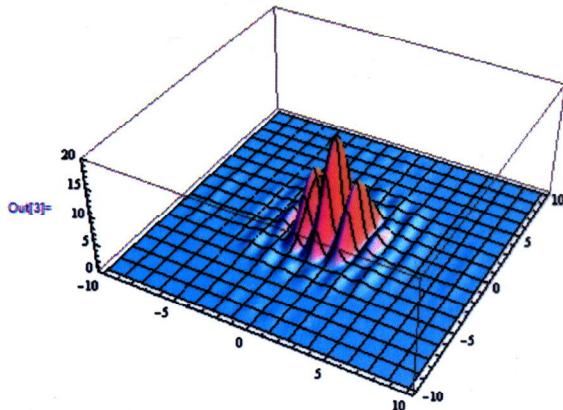

## Intensity of square-circle combo

```
In[1]:= r[x_, y_] = Sqrt[x^2 + y^2]
```

```
Out[1]=  $\sqrt{x^2 + y^2}$ 
```

```
intensity[x_, y_] =
(Abs[B^(I 4 x) Sinc[x/2] Sinc[y/2] + 2 Pi BesselJ[1, r[x, y]] / r[x, y]])^2
Out[2]= Abs[ $\frac{2 \pi BesselJ[1, \sqrt{x^2 + y^2}]}{\sqrt{x^2 + y^2}} + e^{4ix} Sinc[\frac{x}{2}] Sinc[\frac{y}{2}]$ ]
```

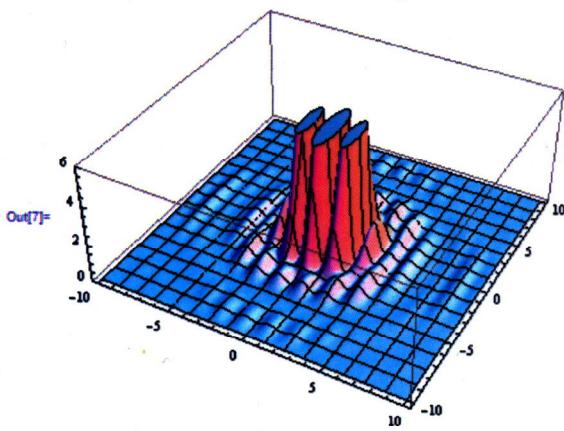

```
In[3]:= Plot3D[intensity[x, y], {x, -10, 10}, {y, -10, 10}, PlotRange -> {0, 20},
PlotPoints -> 100]
```

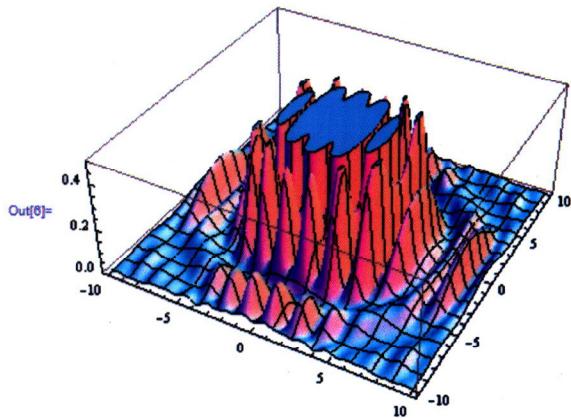

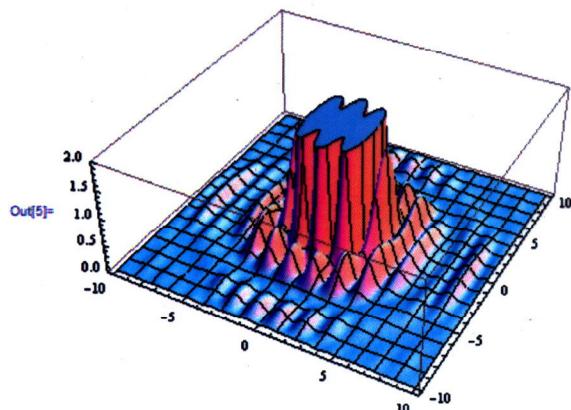

**John S. Colton**

I made  $k = a = d = 1$

You see some interesting symmetries!  
Some square, some circular

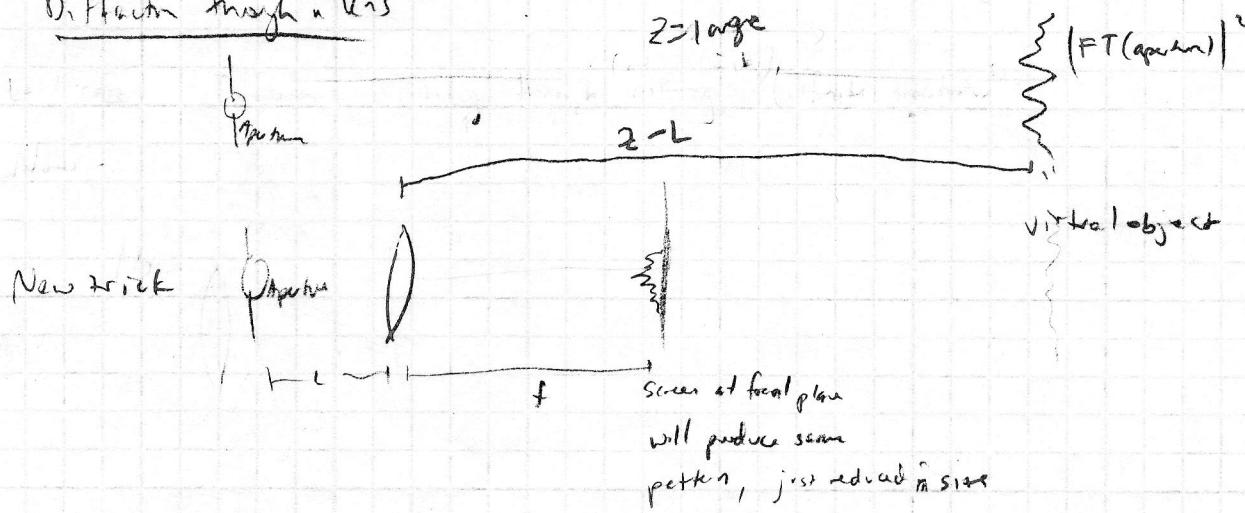

Increasing zoom

## Section 11.4

### Diffracting through a lens

$$\frac{1}{f} = \frac{1}{o} + \frac{1}{i}$$

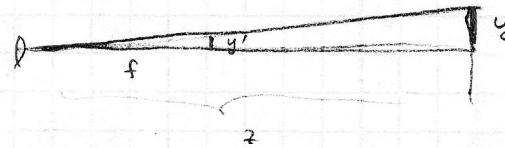

$o = -(z-L)$  virtual object at previous  $z = \text{large}$

$$\frac{1}{f} = \frac{1}{-(z-L)} + \frac{1}{i}$$

$\approx 0$  since  $z = \infty$

$$i \approx f$$

$$M = -\frac{i}{o} = -\frac{f}{-(z-L)} \approx \frac{f}{z}$$

$$\frac{y'}{y} = \frac{f}{z} \rightarrow \frac{y'}{f} = \frac{y}{z} \approx 0$$

Angular size preserved!

Sketch lots of work in book... and result for screen at lens's focal length

Old Fraunhofer:  $E(x, y, z = \text{large}) = -\frac{i}{\lambda d} e^{ikx} e^{\frac{ikr^2}{\lambda d}} \text{FT (aperture)}$

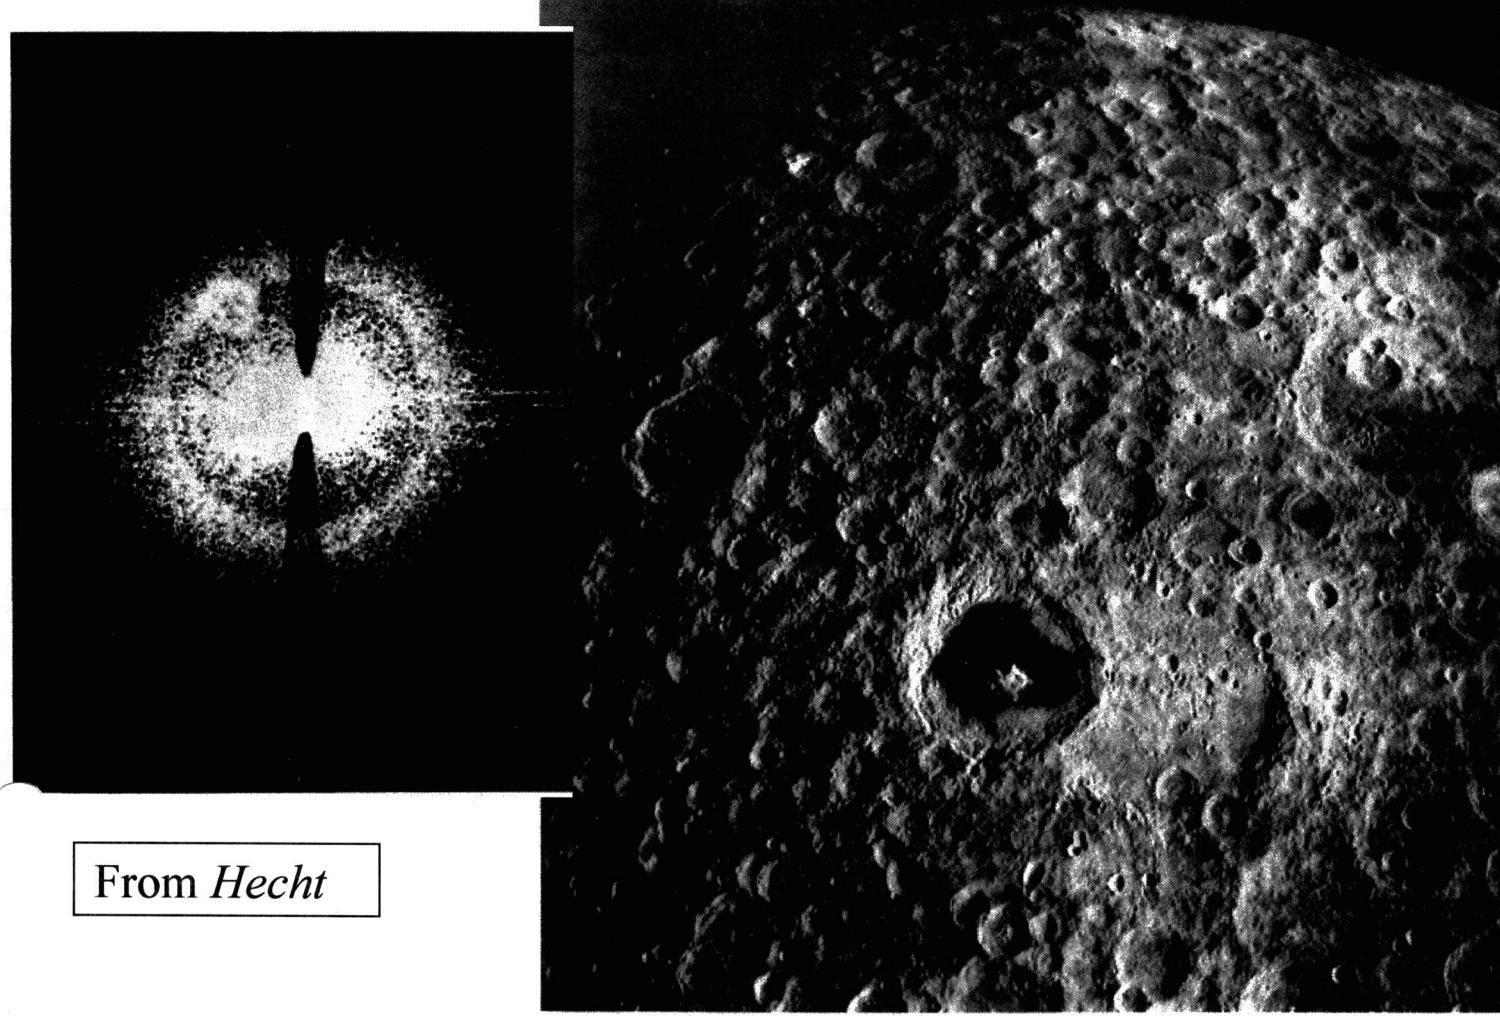

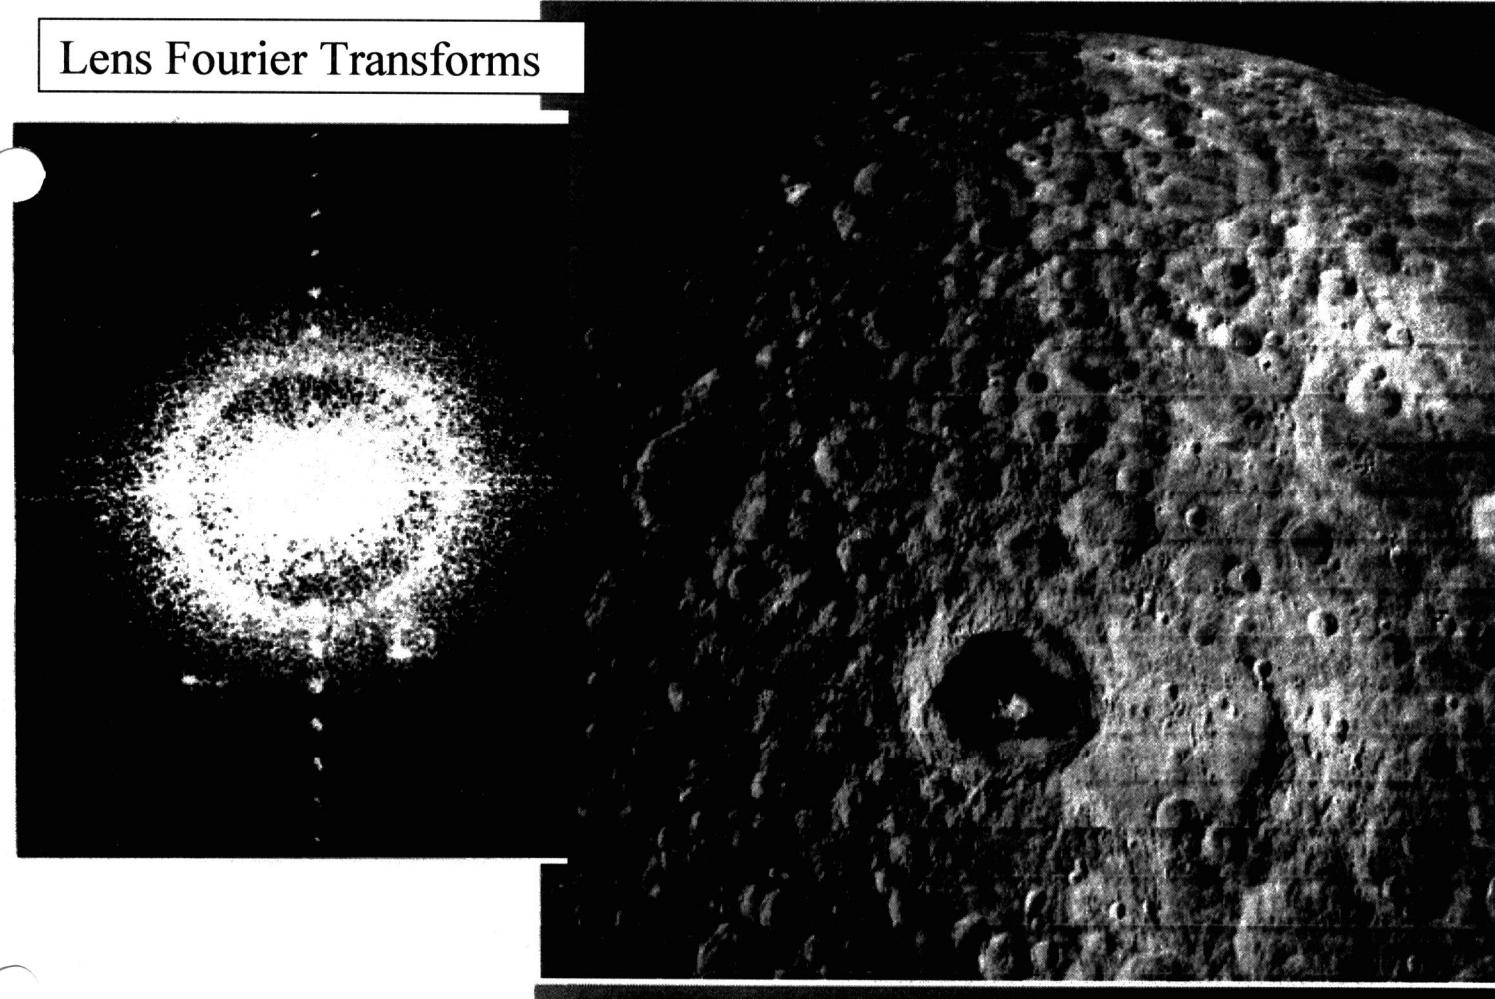

$$r = \sqrt{x^2 + y^2}$$

$$k_x = \frac{kx}{d}, k_y = \frac{ky}{d}$$

▷ New result:  $E(x, y, z = L + f) = -\frac{i}{\lambda f} e^{ik(x+f)} e^{\frac{ikx^2}{2f} - \frac{ik^2 r^2}{2f^2}} \text{FT (aperture)}$

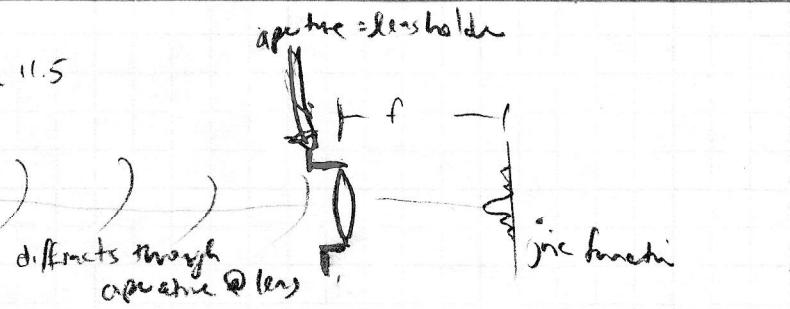

$$\text{with } k_x = \frac{kx}{f}, k_y = \frac{ky}{f}$$

## Lens Fourier Transforms

From Hecht

Telescope sectn 11.5

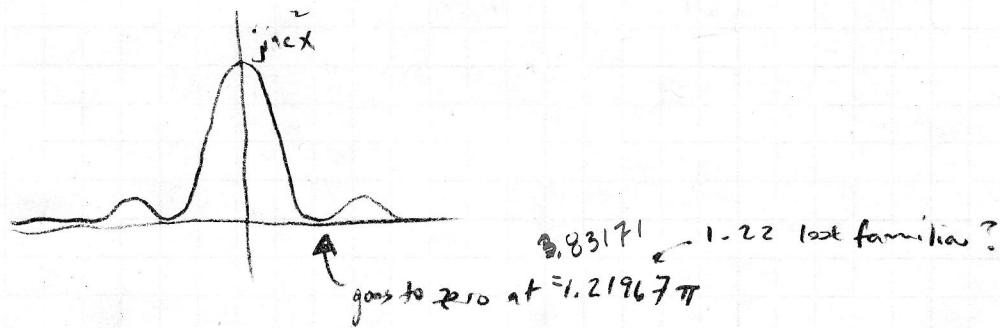

$$I = \frac{I_0}{\lambda^2 f^2} \left( FT(\text{circle}) \right)^2 \rightarrow \text{wrt } kr = \frac{kr}{f} \quad r = \sqrt{x^2 + y^2}$$

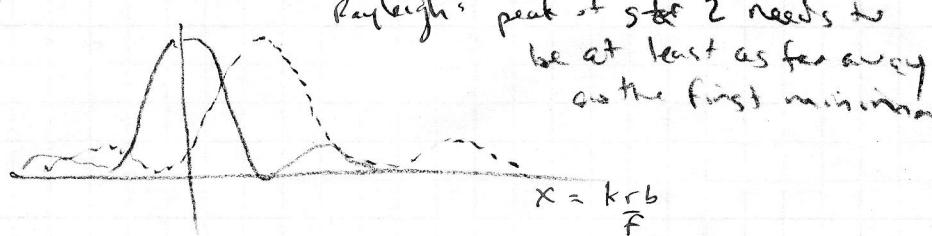

$$(2\pi b)^2 \left( J_1 \left( \frac{krb}{f} \right) \right)^2$$

$$I = \frac{I_0}{\lambda^2 f^2} (2\pi b)^2 \left( J_1 \left( \frac{krb}{f} \right) \right)^2$$

$b$  = radius of lens holder

Resolve two stars?

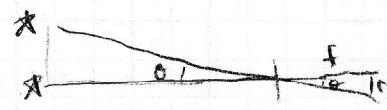

$$\frac{krb}{f} = 1.22\pi$$

$\lambda$  = diameter of lens

$$\frac{2\pi}{\lambda} \frac{r}{f} \left( \frac{\lambda}{2} \right) = 1.22\pi$$

$$\boxed{\frac{r}{f} = \frac{1.22\lambda}{\lambda}}$$

$$\boxed{\Theta = \frac{1.22\lambda}{f}}$$

$$\frac{r}{f} = \tan \theta \approx \theta$$

## Ch. 11. More applications

### Secn 11.2. Diffract off Gaussian field profile

laser beams typically brightest in middle, often have Gaussian fall-off

$$E(x'y') = E_0 e^{-\frac{r'^2}{w_0^2}}$$

$$r' = \sqrt{x'^2 + y'^2}$$

$w_0$  = "beam waist"

$\int$   
(diameter  
not width)

measure of width

→ radius at which Intensity =  $I_0 \left(\frac{1}{e}\right)^2$

$$= 13.5\% I_0$$

How does it propagate? → diffracts through  
"infinite, large aperture"

Back to Fresnel Approximation

$$E(x,y,z) = -\frac{i}{\lambda^2} e^{i\frac{k}{2z}(x^2+y^2)} \int_0^{\infty} \int_0^{\infty} \left[ E_0 e^{-r'^2/w_0^2} \right] e^{i\frac{k}{2z}r'^2 - i\frac{k}{2}(xx'+yy')} e^{ir'd\theta'} r' dr' d\theta'$$

$r \cos\theta \quad r \sin\theta$   
g. similar to  $y$

$-i\frac{k}{2}dr' (\cos\theta \cos\theta' - \sin\theta \sin\theta')$

$C \quad \underbrace{\cos(\theta+\theta')}$

As before,  $\theta'$  integral  $\rightarrow 2\pi J_0\left(\frac{kr'}{2}\right)$

$$= -\frac{i}{\lambda^2} 2\pi e^{ikz} e^{i\frac{kr'^2}{2z}} E_0 \underbrace{\int_0^{\infty} r' dr' e^{-\left(\frac{1}{w_0^2} + \frac{ikr'^2}{2z}\right)} J_0\left(\frac{kr'}{2}\right)}$$

$\downarrow \quad \quad \quad \text{integral table } \int_0^{\infty} e^{-ax^2} J_0(bx) dx = e^{-b^2/4a}$

$-\left(\frac{kr'}{2}\right)^2 / 4\left(\frac{1}{w_0^2} + \frac{ik}{2z}\right)$

$= e^{-\frac{2}{2}\left(\frac{1}{w_0^2} + \frac{ik}{2z}\right)}$

$\leftarrow \text{"normalize" denominator}$

$\approx 2\frac{k}{2z} \left(\frac{2z}{kw_0^2} - \frac{1}{2}\right)$

introduce new symbols

$$E(x,y,z) = E_0 \frac{w_0}{W} e^{-\frac{r^2}{W^2}} e^{ikz + i\frac{kr^2}{2R} - i\tan^{-1}\left(\frac{y}{x}\right)}$$

with

$Z_0 = \frac{k w_0^2}{2}$
$R = z + \frac{Z_0}{2}$
$W = w_0 \sqrt{1 + \frac{z^2}{Z_0^2}}$

} functions of  $z$

Incidentally I think you  
can show this  
satisfies Helmholtz eqn

put in polar form  
 $x = r \cos\theta, y = r \sin\theta$

$$\tan^{-1}(-\frac{y}{x}) = \tan^{-1}(-1) = -90^\circ$$
